1. Write a Pandas program to select the distinct department id from employees file.

AIM: To Write a Pandas program to select the distinct Department IDs from an employees file.

PROCEDURE:

- Import the Pandas library.
- Read the `employees.csv` file into a DataFrame.
- Display the employee records.
- Select the `DepartmentID` column.
- Remove duplicate department IDs using `drop_duplicates()`.
- Display the distinct Department IDs.

OUTPUT:

The screenshot shows a Jupyter Notebook interface with a file explorer on the left, a code editor in the center, and a terminal at the bottom. The code in the notebook is as follows:

```
1 import pandas as pd
2
3 # Read the CSV file
4 employees = pd.read_csv("employees.csv")
5
6 # Display the complete data
7 print("Employee Details")
8 print(employees)
9
```

The terminal output shows the following:

```
D:\Desktop\Query_Processing_Lab\python experiment1.py
Employee Details
EmployeeID EmployeeName DepartmentID Salary
0 101 Alice 10 58000
1 102 Bob 20 45000
2 103 Charlie 10 55000
3 104 David 30 60000
4 105 Eva 20 48000
5 106 Frank 40 70000
6 107 Grace 30 52000
7 108 Henry 50 65000
8 109 Irene 40 62000
9 110 Jack 10 58000

Distinct Department IDs
0 10
1 20
2 30
3 40
4 50
Name: DepartmentID, dtype: Int64
```

RESULT: Thus, the Pandas program to select the distinct Department IDs from the employees file was executed successfully, and the required output was obtained.

2. Write a Pandas program to display the IDs of employees who have done two or more

AIM: To Write a Pandas program to display the IDs of employees who have done two or more

PROCEDURE:

1. Import the Pandas library.
2. Read the `job_history.csv` file.
3. Display the job history records.
4. Group the records by `EmployeeID`.
5. Count the number of jobs for each employee.
6. Filter employees with two or more jobs.
7. Display the Employee IDs.

OUTPUT:

The screenshot shows a Jupyter Notebook in Visual Studio Code. The notebook has three cells. The first cell contains the following code:

```
import pandas as pd
job_history = pd.read_csv('job_history.csv')
job_history
```

The second cell contains the following code:

```
employees = job_history.groupby('EmployeeID').count()
employees
```

The third cell contains the following code:

```
employees[employees['count'] >= 2]
```

The output of the notebook shows the job history records, the grouped counts, and the filtered results. The filtered results are as follows:

EmployeeID	count
101	2
103	3
105	2

RESULT: Thus, the Pandas program to display the IDs of employees who have done two or more jobs was executed successfully, and the required output was obtained.
